

TallyMCP Pro — User Manual (Non-technical)

Version: v1.0.10

Audience: Chartered Accountants, accountants, finance teams

Goal: Read Tally data safely and export professional reports (no posting)

Quick start (1 minute)

Step A — Confirm Tally is ready

1. Open **TallyPrime**
2. **Load the company** you want to work with
3. In TallyPrime:
 - **F1 (Help) → Settings → Connectivity → Client/Server Configuration**
 - Set to **Both**
 - Port **9000**

Step B — Confirm TallyMCP is ready

Open **TallyMCP Configurator** and confirm:

- **Tally connected** (green dot)
- **MCP server running** (green dot)

If you see any red/yellow warnings, open **Health Check** and click **Re-check**.

How to use TallyMCP in Claude Desktop / Cursor

You will type normal questions, but these **starter commands** work best:

- **/config** — first-time setup, connection test, choose company

- `** /read **` — read a report inside chat (Trial Balance, P&L, etc.)
- `** /export **` — export an Excel/JSON file (for working papers)
- `** /audit **` — audit-lite checks + findings + workbook
- `** /dashboard **` — management dashboards (Excel)

Tip: If you are unsure, start with `** /config **`.

1) First-time setup (``/config``)

Copy-paste this prompt:

`** /config **`

"Set up TallyMCP for me. First test the connection. Then show the list of companies and ask me which company to set as default."

What happens next:

- The assistant runs a connection test
 - It lists companies available in Tally
 - You choose one company as the `**default**`
-

2) Read reports inside chat (``/read``)

Use this template:

`** /read **`

"Read `**<Report Name>**` for `**<Company>**` for period `**<FromDate>` to `<ToDate>**`. If I don't give dates, use current financial year."

Common examples (copy-paste)

`**Trial Balance (current FY)**`

`/read` "Trial Balance for my default company."

`**Profit & Loss (FY 2025–26)**`

`/read` "Profit & Loss from 20250401 to 20260331."

****Balance Sheet (as on 31-03-2026)****

`/read` "Balance Sheet as on 20260331."

****Sales Register (April 2025)****

`/read` "Sales Register from 20250401 to 20250430."

****Purchase Register (April 2025)****

`/read` "Purchase Register from 20250401 to 20250430."

3) Export to Excel / JSON (`/export`)

Use this template:

****** `/export` ******

"Export ****<Report Name>**** for ****<period>**** to ****Excel**** and give me the file."

Common examples (copy-paste)

****Export Trial Balance to Excel****

`/export` "Export Trial Balance to Excel for 20250401 to 20260331."

****Export Profit & Loss to Excel****

`/export` "Export Profit & Loss to Excel for 20250401 to 20260331."

****Export Balance Sheet to Excel****

`/export` "Export Balance Sheet to Excel as on 20260331."

****Export Masters (Ledgers / Groups / Voucher Types)****

`/export` "Export Masters to Excel for my default company."

What you get:

- A file path to a generated **Excel workbook** (and sometimes a JSON export option)
-

4) Audit-lite (`/audit`)

Audit-lite is **analytical support only**. It highlights **risk indicators** and suggests checks.

It is **not** a statutory audit opinion.

Copy-paste this prompt:

```
/audit
```

"Run audit-lite for my default company for 20250401 to 20260331. Summarize findings by severity and give me the Excel working paper."

What you get:

- Findings (what looks wrong + why it matters)
 - Suggested audit procedures
 - Excel working paper path
-

5) Dashboards (Excel) (`/dashboard`)

Dashboards are Excel files. Available kinds:

- **ManagementSnapshot**
- **SalesTrend**
- **ExceptionsOverview**

Copy-paste examples:

```
/dashboard "Generate ManagementSnapshot for 20250401 to 20260331 and give me the Excel file."
```

`/dashboard` "Generate SalesTrend for 20250401 to 20260331 and give me the Excel file."

`/dashboard` "Generate ExceptionsOverview for 20250401 to 20260331 and give me the Excel file."

Common problems and quick fixes

A) "Tally not reachable" / "Port refused"

1. Keep TallyPrime open and load the company
2. Check: **Connectivity** → **Both**, Port **9000**
3. In Configurator → **Health Check** → **Re-check**

B) "Firewall rule missing"

- If AI client and Tally are on the **same PC**, it often still works
- If AI client is on a **different PC** (LAN), the firewall rule must be added
- Fix: Run Configurator as **Administrator** → Health Check → **Fix both**

C) Tally becomes slow or hangs

- Do not run heavy exports from **Claude and Cursor** at the same time
 - Start with smaller reports first (Trial Balance / Company Info)
 - If it still hangs: close the AI client, restart TallyPrime, try again
-

Recommended daily workflow

1. `/config` once (set default company)
2. `/read` to check numbers quickly
3. `/export` when you need Excel for working papers
4. `/audit` for exception-based review
5. `/dashboard` for management reporting
